## Virus protection free mac

Compre o Malwarebytes para Mac Premium ou experimente gratuitamente por 14 dias. Você decide. Download gratuito Comprar agora PCs get viruses; Macs don't. You saw it on TV, so you know it's true, right? Like a lot of what you see on TV, it's a bunch of malarkey. Malware targeting Macs exists completely, including annoying types like ransomware. It is true that Windows is an easier target, but antivirus is de rigueur for Windows users. Malware coders rely on the myth of Mac invulnerability to make their job easier. Don't be a Mac malware victim. Read our reviews and choose the antivirus that suites you and your Mac the best. As with Windows antivirus tools, the most common price is just under \$40 a year for a single license. ProtectWorks is unusual in that a single payment of \$29.95 will protect all Macs in your household without needing a subscription. McAfee goes beyond that, with a \$59.99-a-year subscription that protects all your Macs, PCs, Android and iOS devices. With Sophos Home Premium, you can remotely install and manage security on 10 Macs or PCs at \$60 a year. On the high side, you pay \$99.99 per year for a three-license subscription to Intego Mac Internet Security X9 or Airo Antivirus for Mac. When macOS Mojave came out, it advanced security in various ways, including tracker blocking in Safari, a password manager, and a tighter rein on AppleScript. macOS Catalina piled on more security features, with enhanced control over data access permissions, weak password alerts, a strengthened gatekeeper against malware, and more. Still, nothing we've seen suggests that upgrading to Catalina will avoid the need for an antivirus utility. Free Mac Antivirus ProtectionEr is another angle to the variation in Mac antivirus prices. How about paying nothing at all? Avast Security (for Mac), AVG AntiVirus for Mac, Avira Free Antivirus for Mac, and Sophos Home Free (for Mac) are completely free for personal use, although Sophos technically limits you to three devices, macOS or Windows. AVG also offers free antivirus for Mac, but until phishing protection improves, we can't recommend it. The best commercial products offer more protection, but if you can't afford the best, at least install a free antivirus. What is not HereEight commercial macOS antivirus products that 3.5 stars or better earned appears in the list at the top. Another nine managed a decent three-star rating, but there's no room for all of those. I chose to favor two products that originated on the Mac platform, Airo Antivirus for Mac and Intego Mac Internet Security. Avast Security Pro (for Mac), ESET Cyber Security (for Mac), Malwarebytes for Mac Premium, and Vipre Advanced Security (for Mac) also earned three stars. This didn't make it to the map. If you're using a Windows security product from one of these companies, it may make sense to do the same on your Macs. Malware Protection Lab certificationsWhen you're going to select, select a new washing machine, refrigerator, or other device, its good that you investigate first. User reviews can be helpful as long as you throw away the very best and the worst. But the actual test results published by an independent lab give you more reliable information. Two large labs include macOS antivirus products in their testing, but the slate of products for testing is variable. When we first ordered mac antivirus products, we only selected those with at least one certification, but currently many of them don't appear in the test results of both labs. The researchers at AV-Test Institute evaluate Mac antivirus products on three criteria: protection, performance and usability. A product can earn up to six points for each. Protection against malware protection is of course essential, as well as a low impact on performance. A high usability score reflects a small number of false positives, legitimate programs and websites identified as dangerous. In the last report, all but two of the products achieved a perfect 18 points, all six points for all three criteria. Lab Test Results Chart In the macOS malware test by AV-Comparatives, most mapped products scored 100 percent. This lab, too, included a test using malware targeting Windows. Yes, these examples can't affect a computer running macOS, but they can escape to Windows machines on the network. Scores in the Windows malware test ranged from 19 to 100 percent, which is quite a span. This lab recently added a test using PUAs (Potentially Unwanted Applications). Most products came on or near 100 percent against these less-virulent annoyances. Results in macOS-specific tests have spread a much smaller point than in tests of Windows antivirus tools. It's good that many products in the chart have received at least one certification for Mac protection, and even better that some have received two certifications. Hands-On Phishing Protection TestingWhen we test malware protection on Windows, we use live malware in an isolated virtual machine. Over the years, we have encoded a number of analysis tools to help with this testing. However, little of that testing regime transfers to the Mac. Phishing is not platform-specific, and neither is our antiphishing test. Phishing websites imitate secure sites, everything from banks and financial sites to gaming and dating sites. If you enter your credentials on the fake login page, you will have the phisher access to your account. And it doesn't matter if you're browsing a PC, a Mac, or an internet-conscious sewing machine. Almost all products in the chart below are protected from malicious and fraudulent sites. With ClamXAV and Intego, this is simply not an included feature. Malwarebytes and ProtectWorks also lack an antiphishing component. Phishing Chart The cunning culprits who create phishing sites are in the business of deception, and they constantly change and update their techniques, hoping to evade detection. If a fraudulent site is blacklisted or shut down by the authorities, authorities, with a new one. That's why we try to use the latest phishing URLs for testing, by scraping them from phishing-centric websites. We start each URL simultaneously in four browsers. One is Safari or Chrome on the Mac, protected by the Mac antivirus that is being tested. The other three use the security built into Chrome, Firefox and Microsoft Edge. By throwing away anyone who doesn't fit the phishing profile and doesn't load correctly in all four browsers, we report the product's detection rate and the difference between the detection rate and that of the other three test systems. Most of the products in this roundup beat the combined average of the three browsers. Bitdefender and McAfee top the list with 99 and 98 percent detection, respectively. Ransomware ProtectionThe scourge of ransomware is emerging. While ransomware attacks are more common on Windows devices, Macs have suffered as well. Of course, every antivirus utility should deal with ransomware just as it handles spyware, Trojans, viruses, and other types of malware. But because the consequences of missing a ransomware attack are so great, some security products add components with the sole purpose of preventing ransomware attacks. We have observed a wide range of ransomware protection techniques on Windows. These include blocking unauthorized access to user documents, detecting ransomware based on its activity, and restoring encrypted files from backup. Of the products listed here, Bitdefender and Trend Micro offer a ransomware component that blocks unauthorized modification of protected documents. As with the Windows edition of Bitdefender, the Secure Files feature prevents all unauthorized access to your documents from being unauthorized. On a Mac, it also protects your Time Machine backups. Trend Micro offers multiple layers of Windows ransomware protection. Folder Shield, which, like Safe Files, prevents unauthorized access to documents, is the only layer that has found its way into the macOS edition. Sophos Home Premium contains the same CryptoGuard behavior based ransomware protection found in its Windows equivalent. Our Windows testing systems are virtual machines, so we feel free to release real-world ransomware for testing. We just roll back the virtual machine to a clean snapshot after testing. We don't have the ability to do that on the physical Mac testbed, so we just need to figure out that because it worked on Windows, it probably works on macOS. Spyware ProtectionAny type malware problem is unpleasant, but spyware can be the most unnerving. Imagine sneaking up on your Mac webcam! Other forms of espionage include logging keystrokes to capture passwords, sending Trojans to steal your personal information, and viewing your online activities to build a profile. As with ransomware protection, we've observed more features dedicated specifically to spyware protection windows-based security products than on the Mac, but a few products in this collection do pay special attention to spyware. Below Kaspersky's Safe Money feature opens sensitive sites in a secure browser that is hardened against outside interference. The Secure Money feature on the Mac doesn't, but it does check URLs to make sure you're secure on a legitimate secure site. Kaspersky offers an on-screen keyboard so you can enter passwords without a chance to be caught by a keylogger. Webcam protection is not as configurable as on Windows, but you use it to turn off your Mac's webcam when you're not using the webcam. It also includes the ability to block advertisers and others from tracking your online activities. If spyware is your bugaboo, you will, like Kaspersky. Sophos Home Premium, provide protection for the webcam and microphone that is more substantial than Kaspersky's. You'll be notified when an uns trusted program tries to access it; grant you access or stop the program. There's also an option to whitelist a program so you don't get a pop-up every time you use your off-brand video chat tool. Bonus featuresMany antivirus tools on Windows package in a lot of bonus features, packing everything from tuning programs to VPNs. That behavior seems less common on the macOS side, although Norton now includes a VPN with no bandwidth limits. However, some vendors do not have a standalone Mac antivirus, instead opting to offer a full security suite as the basic level of protection, and a few others include suite-like bonus features in the basic antivirus. A typical personal firewall component blocks attacks coming in from the Internet and also manages network permissions for programs installed on your Mac. Intego, McAfee and Norton each have a firewall component, while Kaspersky's Network Protection comes close. Parental controls is another common suite component. With Sophos (free or premium) and Trend Micro Antivirus for Mac, a content filter can block access to websites that match unwanted categories. Kaspersky goes beyond that, with content filtering, screen time limits and control over used apps. An additional \$14.99 per year unlocks all the features of the powerful Kaspersky Safe Kids. Protect Your MacMany from the products earned in this roundup certification from at least one independent testing lab; some managed two certifications. There are really no bad choices here, as far as basic antivirus protection goes. However, a few products stood out. Bitdefender Antivirus for Mac not only achieved certification from both laboratories, it earned the maximum score in each test, and took the top antiphishing score. Kaspersky Internet Security for Mac also achieved high scores. It offers a full suite of Mac security tools, at the same price that competitors in for basic antivirus protection. Norton 360 Deluxe (for Mac) is also a suite, and the features include a no-limits VPN. These three are our Editors' Choice winners for Mac antivirus protection. However, these are not the only choices. Check out our reviews, choose the product that suits you best and get your Mac Mac. Once you've done that, you should also consider installing a Mac VPN. While an antivirus program protects you, your devices, and your data locally, a VPN extends that protection to your online activities, protecting both your security and your privacy. Editor's note: We are aware of the allegations of Kaspersky's improper ties to the Russian government. Until we see some actual evidence of these allegations, we will treat them as unproven, and continue to recommend Kaspersky's security products as long as their performance continues to merit our approval. Approval.
